

Project: ListMenu Specifications

I know how to...

Menus make your web pages look professional.

You can show off your expertise by adding hyperlinks, menus, and lists to your site.

This project will demonstrate the following.

Lists & Sublists

- Make bulleted lists (like this one)
- Make ordered lists (1, 2, 3 etc)
- Make sublists correctly
- Incorporate special characters: < & € ™ © •
- Add horizontal rules to create visual separation on a page.

Hyperlinks

- Linking to another page on your site.
- Linking to a page out on the Web.
- Setting an anchor and linking to it.
- Linking to an anchor on another page.
- Create links to download files to the user's computer
- How to use links with images.
- Create a professional-looking menu system using links and CSS

File Management

Create a folder named **prjListMenu** (Do not use file extensions on your folders!)

This is the folder that you will zip up and submit to your instructor.

This folder will contain:

- **mySkillSet.html** and **aboutMe.html**
 - The non-HTML file
 - The external CSS file: **prjListMenu.css**
 - A subfolder named **graphic** holding all the graphic files
-

Two Gotchas

1. Beware of double extensions!

Make sure your files extensions are all displaying when setting up these files! Don't know how? Go back through the Learning Activities to learn how. Or, use Google: "the name of your Operating System" "show file extensions"

2. Follow the naming conventions so all your file names are consistent.

Remember that the t.server is case sensitive. UPPER/lower case matter!

Forgot the naming conventions? Here they are:

- Always start with a lower case letter
- useCamelCaseToHelpReadability
- Don't use spaces or underscores
- Don't use plurals
- Be consistent - Follow these rules for all folder names and filenames.

Specifications

Create Two New Pages on Your Site

A New Page --> **mySkillSet.html**

Create a page named: **skillSet.html** that contains the heading "My HTML/CSS Skill Set".

This page will contain an unordered list with links to either skillSet.html or aboutMe.html demonstrating your understanding of the different types of links and anchors.

Add a thumbnail image to this page. If the user clicks on the image the browser should display a larger view of the same graphic.

The unordered list should have a subheading "Lists & Links" and include the following items shown in black:

- Using a numbered sublist (When the instructor clicks on this link the browser should jump to the anchor where you have a list with a sub-list using numbers. This could be on mySkillSet.html or on the aboutMe.html)
- Using special characters (When the instructor clicks on this link the browser should jump to the area on the page where you used special characters.)
- Downloading non-HTML files (When the instructor clicks on this link a popup should display asking where to download the file or automatically download the file, either way is acceptable.)
- Link to an anchor on the same page (When the instructor clicks on this page it should jump to another spot on the page. For example, you might jump down to the very bottom of the page.)
- Link to an anchor on another page on the site (When the instructor clicks on this page it should jump to an anchor somewhere on

[aboutMe.html](#). Make certain you jump to an anchor on the page, not just to the top of the page.)

- Link to your t.server site (When the instructor clicks on this link it should display your web site that is published out on the t.server.)

(When the instructor clicks on the image on this page it should display a larger image using hyperlinks. There won't be an item on the list for this one.)

A New Page --> **aboutMe.html**

1. Create a second page named **aboutMe.html** containing lots of copy and several subheads relating to your resume or portfolio (or the main topic of your site). For example, you can write a narrative of your life (or use [lorem ipsum](#) text) with sub-headings such as: My Earliest Memory, Experiences That Changed My Life, The Perfect Job for Me (and why), Three of my Strengths and How I Use Them, My Mentors.

You won't be graded on the content so don't spend a lot of time right now on your composition. Later, you can add to this page as you see fit, when updating your resume/portfolio as part of your job networking tools.

2. Create an anchor for each subhead on the page. You can either use the `<a name=" "></a>` element or use the `id=" "` inside each of the subhead tags.

3. Go back to the `skillSet.html` and make each item in the unordered list a hyperlink to the page and an anchor where that example can be found. (This will demonstrate that you can link to an anchor on another page.)

Every link on your website must open in a new page/tab.

Create a Menu

Create a Menu using an External CSS file for `index.html` and the other two pages.

On your `index.html` create a menu that will allow users to view any of the

other .html files on your site using CSS and the techniques from the menu learning activity in the Module: Hyperlink.

The CSS for this menu should be in an external style sheet.

A list of hyperlinks is not acceptable as a menu. You want to utilize CSS to make the list look like a series of buttons along the top or the side of the page similar to the menu lab in the Learning Activities.

Duplicate this menu on each page on your project.

Validate all of your pages.

Add the necessary files to your local 06public_html for your published web site. Check all the links and make sure all the photos are in the graphic folder. Once your site looks good on your local 06public_html, FTP all the new files up to your t.server account.

What to submit to D2L

1. Go through the [Grading Checklist](#) at the end of these specifications to make sure you have everything. This is what your instructor will be using to grade your work. (Be smart and have another person go through the Grading Checklist as you show them how you completed each item.)
2. Zip up the folder named **prjListMenu** containing:
 - mySkillSet.html
 - aboutMe.html
 - the external .css file
 - any graphic files
 - the non-HTML file
3. Name this zip file: **prjListMenu.zip**
4. Submit this zip file to D2L.

5. You will be graded using the files in the dropbox.

Grading Checklist

Total Points Possible: 55 points

5 points - mySkillSet.html contains an unordered list that includes these items:

- Using a numbered sublist
- Using special characters
- Downloading non-HTML files
- Link to an anchor on the same page
- Link to an anchor on another page on the site
- Link to your t.server site
- Using hyperlinks with images

5 points - aboutMe.html contains lots of copy and several headings

An anchor for each subhead on the page using a hidden anchor or the id=" " technique.

20 points total - Demonstrate the following items on your site:

(Each of these items will have an anchor to it so you can jump to this spot in the code from the list on mySkillSet.html)

2 points - Using a numbered sublist correctly

1 points - Using at least 3 special characters

2 points - Downloading a non-HTML file

3 points - Link to an anchor on the same page

4 points - Link to an anchor on another page

3 points - Link to your t.server

5 points - Linking to a larger image from a thumbnail-size image

15 points - Create a Menu using an external CSS file using the technique used in the Learning Activities

On each page of your web site include a menu using CSS linking to all the other pages on the site.

The CSS should be in an external style sheet named prjListMenu.css

5 points - All pages must be valid HTML code using the W3C Validator.

5 points - FTP working files up to t.server
