

Project: SEO GIMP

Specifications

I know how to...

Being published. What a great feeling.

You can show off your expertise using FTP and GIMP by completing this project.

This project will demonstrate the following:

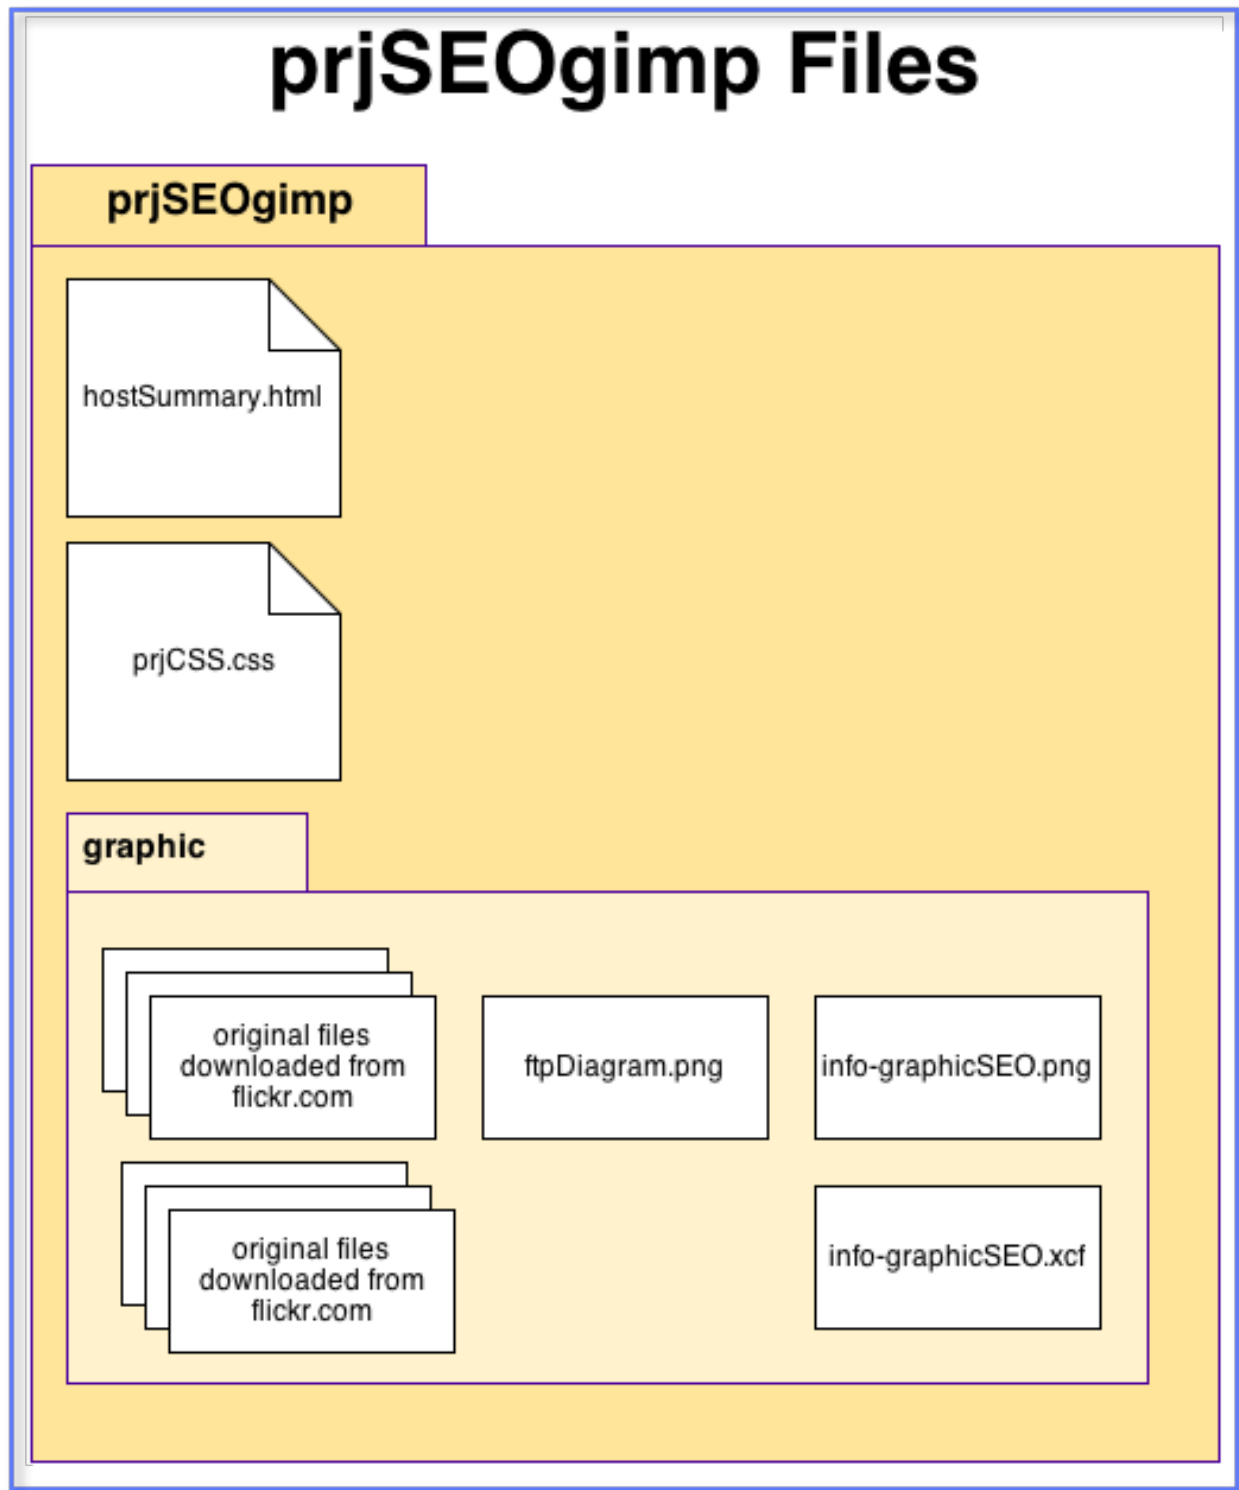

- I understand the difference between domain names and buying a hosting service.
- I can find out if someone already has a domain name registered.
- I know several of the tricks for improving the SEO of a web page.
- I know how FTP works and can draw you a sketch to explain it visually.
- Using an FTP program I can publish web pages to my site so others can view them 24/7 (24 hours/7 days a week).
- I know how to set up my web site on my flash drive or computer using a specific folder (06public_html) before I publish the files out to the web server.
- I know how to use GIMP to:
 - Create a montage of several photos.
 - Create animated GIF photos.
 - Resize, crop, and modify images
- I know how to use meta tags for a description of the web site as well as other useful meta data (information about the web page)s.

File Management

1. Create a folder named **prjSEOGimp** (Do not use a file extension on your folders!)

- This is the folder that you will zip up and submit to your instructor.
- You will be using this folder to hold:
 - All the original images
 - The GIMP (.xcf) file
 - The finished info-graphic (Will be named: info-graphicSEO.png)

Here is a graphic showing how your project folder will look after the project is finished:

2. Create a second folder (OUTSIDE of prjSEOGimp) named: 06public_html.

- You may already have created this folder at the beginning of the

course when you originally set up the folder structure for the course.

- This will be where you will put all the files you want to publish out to your web site.
- Only include the essential files. Leave off any files that are not essential to the published website. (Space is at a premium out on the web server so don't file it up with files you are using.)
- There will be some duplicate files in both folders.

Here is a graphic showing some of the files that will be in your web site folder.

These are the files that will be copied up to the t.server.

Notice that only the .png files are included. The GIMP and other photos are not needed out on the web server.

Why the two different folders?

Folder: prjSEOGimp

The folder prjSEOGimp is used to save your work for this project.

You will only be using this folder for your work on this project.

Folder: 06public_html

The folder 06public_html is a staging folder where you will put copies of all the files you want to publish out to the server.

Once you have those files working you will be copying files from both Project: Web Page and Project: SEOGimp putting them into 06public_html. You will be using this folder throughout the course as you continually update and change your website.

This will allow you to test the web pages for broken links and missing images before you FTP them up to the web server.

- 06public_html will be your "publishing" folder on own computer or flash drive.
 - You will be using FTP to copy all the files inside of 06public_html up to the t.server.
 - Only include the essential files you need inside of 06public_html so you don't waste any space when you copy them out to the server.
 - Make sure all your pages work in 06public_html (for example: missing images) before FTPing up to the t.server.
 - The files inside of 06public_html should be self-contained and not link to any files outside of this folder!
-

Two Gotchas

1. Beware of double extensions!

Make sure your files extensions are all displaying when setting up these files! Don't know how? Go back through the Learning Activities to learn how. Or, use Google: "the name of your Operating System" "show file extensions"

2. Follow the naming conventions so all your file names are consistent.

Remember that the t.server is case sensitive. UPPER/lower case matter!

Forgot the naming conventions? Here they are:

- Always start with a lower case letter
- useCamelCaseToHelpReadability
- Don't use spaces or underscores
- Don't use plurals
- Be consistent - Follow these rules for all folder names and filenames.

So.... why does 06public_html and public_html (out on the t.server) use an underscore?

The t.server is a Linux web server. The people that wrote Linux already named the folder public_html. So, we are just following their lead and making this exception. They weren't aware of the Computer Careers naming conventions when [Linux was written in 1991](#).

Specifications

There are three parts to this project:

1. A web page showing hosting information and how FTP works (ftpDiagram.png)
2. Actually publishing your web pages to the Web using FTP
3. A web page showing SEO Tips with graphics (info-graphicSEO.png)

Part I - Create a web page showing hosting recommendations

1. Create a simple graphic named ftpDiagram.png showing how the Web and FTP works.

You can start with the diagram you created earlier in this course (Project: CSS) and add the FTP information showing the difference between http:// and ftp://

The graphic should include:

- Files on the hard drive
- The ftp:// Server and the Web http:// server
- The port that ftp:// uses
- The port that http:// uses
- Where a userid/password is used to limit access.
- Name the graphic: ftpDiagram.png

You can use any drawing tool you want including pencil and paper.

2. Come up with a list of at least 10 domain names for your site.

The names should:

- Be easy-to-remember and easy-to-spell
- Describe what your site will be about (i.e. your name if you are building an online portfolio)
- Be marked showing which domains are already taken and which are available. (Use [InterNic](#)).

At the bottom of the list write a short paragraph listing the domain name you would recommend and why.

3. Create a comparison chart or list for at least three different web hosting companies.

This list or chart should include:

- Type of server (Windows IIS or Linux Apache?)
- Cost per month based on one year of service
- Any setup fees?
- How much disk space is available?
- Number of email accounts allowed
- Type of support. Phone (what hours), chat, or just email?
- PHP and MySQL available?

If you already has a hosting service include this host as part of your comparison. Use Google.com and search for "web hosting comparison " (Use quotes so the search includes all words together.)

4. Create a web page to display this information including meta tags

a) Create a web page named hostSummary.html

b) Add meta tags in the <head> element of all the that will do the following:

- Description of the purpose of the the page. It should contain 100-120 words with the most important information first. This is the first thing people will see when viewing the results of a Google search.
- Robot meta tag to keep the page from showing up on the search engines. This will keep your work from "competing" with your client's "live" web pages once you've published your project to the t.server.

c) Include the graphic showing how FTP works.

d) Display the list of domain names. Display the names that are available using the element. Add a note at the bottom telling the user what

the bold text signifies.

e) Display the comparison list for the three different hosting companies.

Part II - Publish your work out to the t.server.

1. Copy the files that you created for Project: CSS (your resume page) and paste them into the folder named 06public_html.

- Make certain you are making a copy and not just moving them. That way you can always go back to the original HTML
- Make sure to get all the files including the graphic folder.
- View the index.html page to make certain everything is working okay. Fix what is broken.

2. Copy the files that you created for this project and paste them into the 06public_html folder.

3. FTP all of the files and folders inside of your 06public_html staging folder up to the public_html on the t.server.

- Don't FTP the actual public_html folder! Just the files inside of it.
- Access the home page out on the Web using this URL pattern:
`http://yourfirstnameYourlastname.t.southcentral.edu`
For example: `http://pedroj.t.southcentral.edu`
- Only make changes on your local files. Then, FTP a copy out to your t.server.

Think of FTP as a one-way street from your local files up to the server.

If you decide to make changes out on the t.server you will end up with two different web sites (one on your local drive and slightly different one out on the server.) Doing this may void your warranty and your instructors cannot be responsible for your sanity :-(

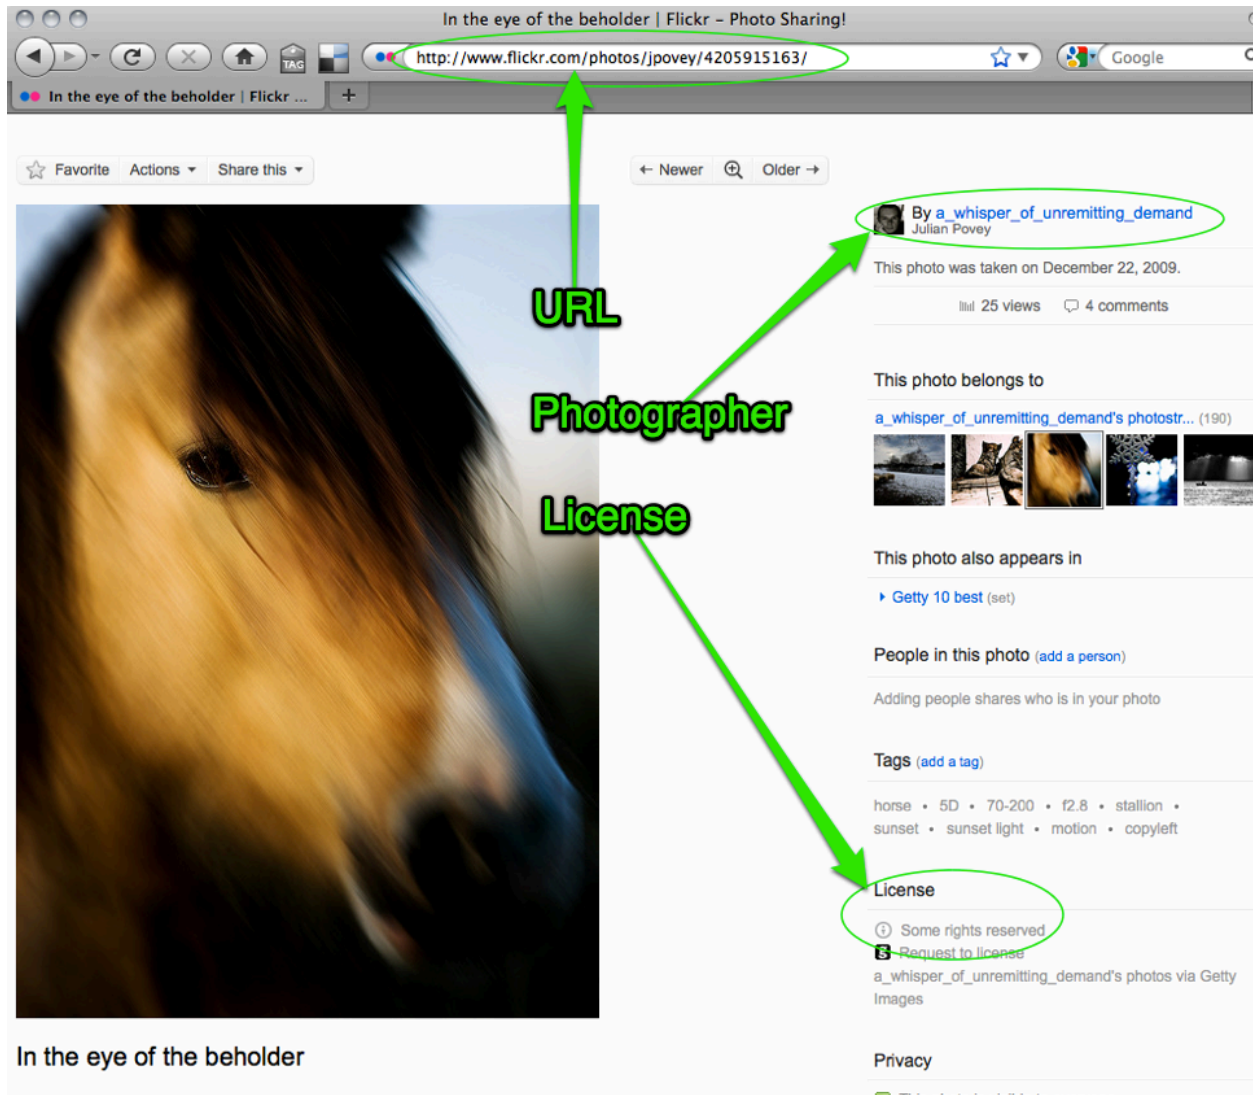

Part III - Use GIMP to create an info-graphic describing SEO tips.

1. Collect 2-5 different photographs using photos from [Flickr.com](https://www.flickr.com/) that have a Creative Commons License.

- Don't know how to do this? Go back to the Module:HTML and review the Tutorial: Working with Images.)
- For each image you use include a screen shot showing the URL, the image, the photographer's name, and the License rights. This screen shot should be a .jpg or .gif type file.
- Store these files in your prjSEOgimp folder.
-

Here is an example (the layout of the [Flickr.com](https://www.flickr.com/) web pages will probably have a different layout. They are constantly changing the look and feel of the site).

Look for the page that has the most information about the photo you choose. Most important is the URL and the photographer's name.

2. Create a montage graphic using a photo editing program such as Gimp.

- Name this file info-graphicSEO.xcf (use .psd if you are working in PhotoShop.)
- The poster should 800x600 pixels (so it will display on any desktop monitor)
- The poster should include extracted areas from at least two photographs.
- Simply adding rectangle shapes to your poster is not enough for points.
- Use one of the detailed selection tools that you learned about in the GIMP tutorials.

- The poster should also include some text (see steps #3-6 below).

3. Include two SEO tips that you discovered on the Web. Be as succinct as possible.

4. Include a URL web address where you got each SEO tip from.

5. Include photo credits for each image you use in small type at bottom of the poster.

These must be readable and not lost against a busy background.

6. Include your name and email address at the bottom of the poster.

This must be readable and not lost against a busy background.

7. Export the finished image as a .png file that can be viewed on a web site with 72 dpi.

Name this file info-graphicSEO.png

A web browser isn't programmed to display a Gimp or PhotoShop file. That's why you have to export it as a .png.

8. Add this info-graphicSEO.png file at the bottom of your hostingSummary.html web page.

Here is an example of the SEO info-graphic from Douglas Crosby and Alexandar Jarvis.

S.E.O.

Search Engine Optimization

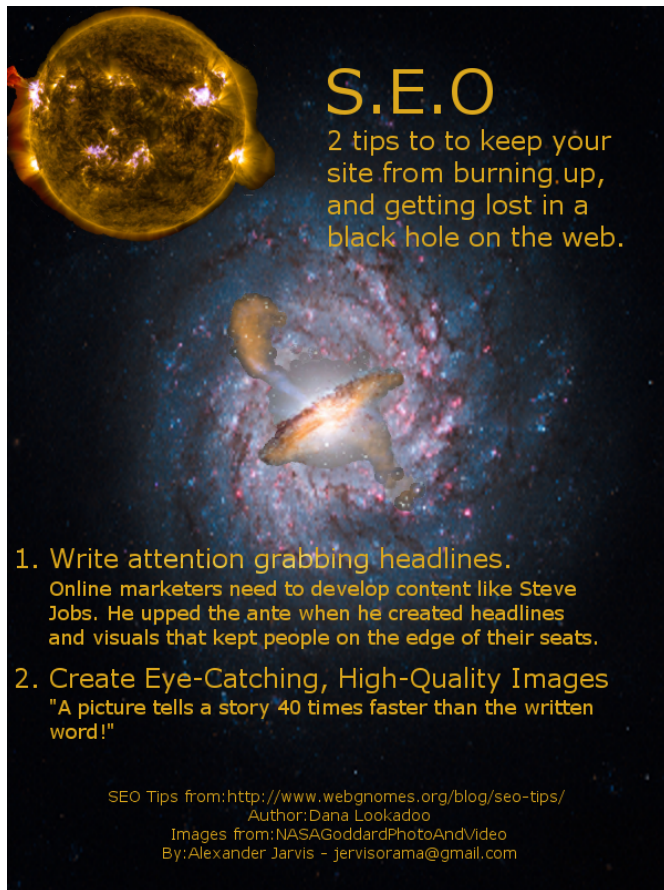

Search engine optimization (SEO) is the process of improving the volume or quality of traffic to a web site from search engines via "natural" or un-paid ("organic" or "algorithmic") search results as opposed to search engine marketing (SEM) which deals with paid inclusion. Typically, the earlier (or higher) a site appears in the search results list, the more visitors it will receive from the search engine. SEO may target different kinds of search, including image search, local search, video search and industry-specific vertical search engines. This gives a web site web presence.

Bold Keywords
A few, well placed enhancements
Your Information

Site Map
A reference to every page
Search engines can explore quicker
Easy user navigation

Deep Linking
Have more than a homepage
A "deep" website with many links
Interesting, popular, worthwhile

Here is an example done by Reed White:

What to submit to D2L

1. Go through the [Grading Checklist](#) at the end of these specifications to make sure you have everything. This is what your instructor will be using to grade your work.
2. Zip up the folder named prjSEOGimp (containing hostSummary.html, the original graphic files from [flickr.com](https://www.flickr.com/photos/reedwhite/), the GIMP files, and the final .png file)
Name this file: prjSEOGimp.zip
3. Submit this zip file to D2L.
4. In the "Notes" section of this drop box add the link to your web site.
 - View your web page out on the t.server
 - Copy your URL address. (Highlight and use CTRL c)
 - Paste this into the "Notes" area of the dropbox (Position the cursor

and hit CTRL v)

Notes & FAQ

Notes

1. All folder and file names must be as specified. UPPER/lowercase matter. All filenames and folders must follow the naming conventions.
 - Always start with a lower case letter.
 - No spaces and no underlines "_".
 - useCamelCaseForReadability
 - Don't use plurals.
 - File extensions should be lower case.
2. Make sure your text editor changes all TABs to three spaces. Points will be taken if any TABS are found in the code. Do a Google search to learn how to view the visible spaces for the editor you are using.

FAQ - Frequently Asked Questions

My drawing program creates files with a different extension? How do I make that into a .png file?

Look for a File/Export command.

Or, simply take a screen shot of your drawing using the tools you learned about in the first module of this course. (Make sure the image is as large as possible when you do the screen shot so you can get all the details even if you make the image smaller later.)

Why does 06public_html and public_html (out on the t.server) use an underscore? This doesn't follow the naming conventions!

The t.server is a Linux web server. When Linus Torvalds wrote Linux he named the folder public_html. So, we are just following his lead and making this exception. Linus wasn't aware of the Computer Careers naming conventions when he developed [Linux back in 1991](#).

How do I make certain the file extensions are showing in Windows

Explorer?

Go back to the Module: File Management and look in the Tutorial: 5 Flash Tricks.

How do I make certain my text editor is changing all TABS into three spaces automatically?

If you are using Notepad++ you will find instructions on how to set up the editor so it always changes TAB characters into 3 spaces.

Look in the Module: Tools under the Learning Activity: Install a text editor on your flash drive. There is a screen shot there showing how to change this setting.

If you are using another text editor do a Google search for: <name of the text editor> change TAB to spaces

To see if you have any TABs in a document use View/Show Symbol/Show All Characters or View/Show Symbol/Show White Space and Tab.

If you are using another text editor do a Google search for: <name of the text editor> show spaces

I didn't use the TAB key but, I still have TABS in my code. Why is that?

Most text editors automatically indent your code using the TAB character. Just by hitting ENTER you may be introducing TABS into your document. (That is why you want to change the setting to automatically change all TABs to 3 spaces.)

If you do have TABs in your document simply use CTRL F (Find) and search for the TAB character and replace it with three spaces. On many systems the /t is the same as hitting the TAB key.

Grading Checklist

Total Points Possible: 60 points

PART I - Create a web page showing hosting recommendations

10 points - Create a simple graphic named ftpDiagram.png showing how the Web and FTP works.

The graphic should include:

- Files on the hard drive
- The ftp:// Server and the Web http:// server
- The port that ftp:// uses
- The port that http:// uses
- Where a userid/password is used to limit access.
- Name the graphic: ftpDiagram.png

5 points - Come up with a list of at least 10 domain names for your site.

The names should:

- Be easy-to-remember and easy-to-spell
- Describe what your site will be about (i.e. your name if you are building an online portfolio)
- Be marked showing which domains are already taken and which are available. (Use [InterNic](#)).

At the bottom of the list write a short paragraph listing the domain name you would recommend and why.

5 points - Create a comparison chart or list for at least three different web hosting companies.

This list or chart should include:

- Type of server (Windows IIS or Linux Apache?)
- Cost per month based on one year of service
- Any setup fees?
- How much disk space is available?

- Number of email accounts allowed
- Type of support. Phone (what hours), chat, or just email?
- PHP and MySQL available?

10 points Create a web page - hostSummary.html - to display this information including meta tags

- Add meta tags for description and robot
- Include the graphic showing how FTP works.
- Display the list of domain names. Display the names that are available using the element. Add a note at the bottom telling the user what the bold text signifies.
- Display the comparison list for the three different hosting companies.

PART II - Publish your work out to the t.server.

10 points - FTP all of the files and folders inside of your 06public_html staging folder up to the public_html on the t.server.

- In the "Notes" section of this drop box add the link to your web site.

PART III - Use GIMP (or another photo editing program) to create an info-graphic describing SEO tips.

5 points - Collect 2-5 different photographs using photos from [Flickr.com](https://www.flickr.com/) that have a Creative Commons License.

- For each image have screen shot showing the URL, the image, the photographer's name, and the License rights. See example. (Click on the image for a larger view) This screen shot should be a .jpg or .gif type file.

15 points - Create a montage graphic - info-graphicSEO.png - using a photo editing program such as Gimp.

- Name this file info-graphicSEO.xcf (use .psd if you are working in PhotoShop.)
- The poster should 800x600 pixels (so it will display on any desktop monitor)

- The poster should include extracted areas from at least two photographs.
- Simply adding rectangle shapes to your poster is not enough for points.
- Use one of the detailed selection tools that you learned about in the GIMP tutorials.
- The poster should also include some text (see steps #3-6 below).
- Include two SEO tips that you discovered on the Web. Be as succinct as possible.
- Include a URL web address where you got each SEO tip from.
- Include photo credits for each image you use in small type at bottom of the poster.
- Include your name and email address at the bottom of the poster.
- Add this info-graphicSEO.png file at the bottom of your hostSummary.html web page.

Last update: 11/25/2013 - Changed file names to hostSummary.html to be consistent with file names in graphics.

04/07/2014 - Added SEO poster from Alexander Jarvis.
